#### Abstract

It is known that $\left(\mathbb{Z}_{n},-_{n}\right)$ are examples of entropic quasigroups which are not groups. In this paper we describe the table of characters for quasigroups $\left(\mathbb{Z}_{n},-{ }_{n}\right)$.

Keywords: quasigroups, eigenvectors, eigenspaces, characters of quasigroups. 2000 Mathematics Subject Classification: 20N05.

## 1. Introduction

The theory of characters of finite quasigroup has been already considered by J.D.H. Smith in [3].

[^0]A quasigroup $(Q, \cdot)$ is a set $Q$ equipped with a binary multiplication operation denoted by - or juxtaposition of the two arguments, in which specification of any two of $x, y, z$ in the equation $x \cdot y=z$ determines the third uniquely.

A quasigroup $(Q, \cdot)$ is called entropic if

$$
(x \cdot y) \cdot(z \cdot t)=(x \cdot z) \cdot(y \cdot t)
$$

for all $x, y, z, t \in Q$.
Let $(Q, \cdot)$ be a finite quasigroup. Now we describe how to obtain the character table of $Q$ (see [3], Chapter 5).

Let $R: Q \rightarrow Q!; x \mapsto R(x)$ and $L: Q \rightarrow Q!; x \mapsto L(x)$, where $R(x)(q)=q \cdot x$ and $L(x)(q)=x \cdot q$. Then the subgroup $G=\operatorname{Mlt}(Q, \cdot)$ of $Q$ ! generated by the union $R(Q) \cup L(Q)$ is called the multiplication group of the quasigroup ( $Q, \cdot$ ).

The group $G$ acts onto $Q \times Q$ in the following way:

$$
g: Q \times Q \rightarrow Q \times Q ; \quad(x, y) \mapsto(g(x), g(y)) .
$$

The orbits $\left\{C_{1}, \ldots, C_{s}\right\}$ of $G$ on $Q \times Q$ under this action are called the conjugacy classess of $Q$.

We consider the incidence matrix $a_{i}$ of the conjugacy class $C_{i}$. This is $0-1$-matrix having 1 as its $x y$-component if $(x, y) \in C_{i}$ and 0 otherwise.

The space $\mathbb{C} Q$ can be decomposed as a direct sum of subspaces $E_{j}$ such that
(a) $\quad \forall_{1 \leq i \leq s}, \exists \exists_{\xi_{i j} \in \mathbb{C}} E_{j}\left(a_{i}-\xi_{i j} I\right)=\{0\} ;$
(b) $\quad \forall_{j \neq k}, \exists_{i} \xi_{i j} \neq \xi_{i k}$;
(c) $\quad E_{1}=\mathbb{C}\left(\sum_{q \in Q} q\right)$.

To get (a) and (b), decompose $\mathbb{C} Q$ into $a_{1}$-eigenspaces, then decompose each of these into $a_{2}$-eigenspaces, and so on. In the case of quasigroup $\left(\mathbb{Z}_{n},-{ }_{n}\right)$ it is enough to end this process with $a_{2}$-eigenspaces. Let $e_{j}: \mathbb{C} Q \rightarrow E_{j}$ be the projection onto $E_{j}$. Define $(s \times s)$-matrix $\Xi=\left(\xi_{i j}\right)$ by $a_{i}=\sum_{j=1}^{s} \xi_{i j} e_{j}$.

Finally the character table of the quasigroup $Q$ is the complex $(s \times s)$ matrix $\Psi$ with components

$$
\psi_{i l}=\left(f_{i}\right)^{\frac{1}{2}} \xi_{l i} n_{l}^{-1}
$$

for $i, l=1, \ldots, s$, where $f_{i}=\operatorname{dim}_{\mathbb{C}} E_{i}$ and $n_{l}=\frac{\left|C_{l}\right|}{|Q|}$.
For more details see $[1,3,5]$.
In this paper we find the character tables of quasigroups $\left(\mathbb{Z}_{n},-_{n}\right)$.
If $i, j \in \mathbb{Z}_{n}$ then

$$
i-{ }_{n} j=\left\{\begin{array}{l}
i-j \text { for } i \geq j \\
n+i-j \text { for } i<j
\end{array}\right.
$$

Every quasigroup $\left(\mathbb{Z}_{n},-_{n}\right)$ has the following conjugacy classes:

$$
C_{i}=\left\{(k, t) \in \mathbb{Z}_{n}^{2}:|k-t|=i-1 \text { or }|k-t|=n-i+1\right\}
$$

for $i=1, \ldots,\left[\frac{n}{2}\right]$.
One can check that $\left|C_{j}\right|=n$ if $j=1$ or $\left(j=\frac{n}{2}+1\right.$ and $\left.2 \mid n\right)$ and $\left|C_{j}\right|=2 n$ otherwise.

This is a ,,road map" through the lemmas in this paper:

## 2. Notations

For $n \in \mathbb{N}, 0 \leq m \leq\left[\frac{n}{2}\right]$ and $m \in \mathbb{N}$ let

$$
x_{n, m}= \begin{cases}2 \cos \frac{2 m \pi}{n} & \text { if } 2 \mid n \\ (-1)^{m} 2 \cos \frac{m \pi}{n} & \text { otherwise } .\end{cases}
$$

For $n \in \mathbb{N}$ define the function $g_{n}: \mathbb{Z} \rightarrow\left\{0,1, \ldots,\left[\frac{n}{2}\right]\right\}$ in the following way $g_{n}(x)=\operatorname{dist}(x, n \mathbb{Z})$. Let $a_{i}$ be the incidence matrix of the conjugacy class $C_{i}$. This is $0-1$-matrix having 1 as its $x y$-component if $(x, y) \in C_{i}$ and 0 otherwise. Let $w_{n}$ be the characteristic polynomial of $a_{2}$.

## 3. Main theorem

In this section we prove a recursive formula for the characteristic polynomial of the matrix $a_{2}$. Before that we give and prove necessary lemmas.

Lemma 1. For every $n \geq 3$ we have

$$
w_{n+2}(x)=-x w_{n+1}(x)-w_{n}(x)+(-1)^{n}(2 x-4) .
$$

Proof. Let $v_{n}=\left(b_{i j}\right)_{1 \leq i, j \leq n}$ be the matrix such that

$$
b_{i j}=\left\{\begin{array}{cll}
0 & \text { for } & |i-j| \geq 2 \\
1 & \text { for } & |i-j|=1 \\
-x & \text { for } & i=j
\end{array}\right.
$$

By Laplace's expansion of the determinant along 1 column we have

$$
\begin{equation*}
v_{n}(x)=-x v_{n-1}-v_{n-2}(x) . \tag{1}
\end{equation*}
$$

Using again Laplace's formula to expand the determinant along 1 column and 1 row we have

$$
\begin{align*}
w_{n}(x) & =-x v_{n-1}(x)-\left(v_{n-2}+(-1)^{n}\right)+(-1)^{n+1}\left(1+(-1)^{n} v_{n-2}(x)\right) \\
& =-x v_{n-1}(x)-2 v_{n-2}(x)+2 \cdot(-1)^{n+1} \tag{2}
\end{align*}
$$

Now we obtain

$$
\begin{aligned}
w_{n+2}(x) & \stackrel{(2)}{=}-x v_{n+1}-2 v_{n}+2 \cdot(-1)^{n+1} \stackrel{(1)}{=}-x\left(-x v_{n}(x)-v_{n-1}(x)\right) \\
& -2 v_{n}(x)+2 \cdot(-1)^{n+1}=v_{n}(x)\left(x^{2}-2\right)+x v_{n-1}(x)+2 \cdot(-1)^{n+1} \\
& =\underbrace{x^{2} v_{n}(x)+2 x v_{n-1}-2 x(-1)^{n}}_{=-x w_{n+1}(x)}-2 v_{n}(x)-x v_{n-1}(x)+2 x(-1)^{n} \\
& +2(-1)^{n+1} \stackrel{(2)}{=}-x w_{n+1}(x)+\underbrace{x v_{n-1}(x)+2 v_{n-2}(x)-2(-1)^{n+1}}_{=-w_{n}(x)} \\
& \underbrace{-2 x v_{n-1}(x)-2 v_{n}(x)-2 v_{n-2}(x)}_{=0}+4(-1)^{n+1}+2 x(-1)^{n} \\
& =-x w_{n+1}(x)-w_{n}(x)+(-1)^{n}(2 x-4) .
\end{aligned}
$$

Let $u_{n}(x)$ be a polynomial such that $u_{2 n+2}(x)=u_{2 n+1}(x)-u_{2 n}(x), u_{2 n+1}(x)$ $=(x+2) u_{2 n}(x)-u_{2 n-1}(x)$ and $u_{1}(x)=u_{2}(x)=1$.

Lemma 2. For every $n \in \mathbb{N}$ we have
(a) $\quad(x+2) u_{2 n}(x) u_{2 n+1}(x)=u_{2 n+1}^{2}(x)+(x+2) u_{2 n}^{2}(x)-1$,
(b) $\quad(x+2) u_{2 n+2}(x) u_{2 n+1}(x)=u_{2 n+1}^{2}(x)+(x+2) u_{2 n+2}^{2}(x)-1$.

Proof. For $n=1$ it is clear. Assume that lemma is true for $n$. We prove this lemma for $n+1$.

$$
\begin{aligned}
& u_{2 n+3}^{2}(x)+(x+2) u_{2 n+2}^{2}(x)-1=\left((x+2) u_{2 n+2}(x)-u_{2 n+1}(x)\right) u_{2 n+3}(x)+ \\
& (x+2) u_{2 n+2}^{2}(x)-1=(x+2) u_{2 n+2}(x) u_{2 n+3}(x)-u_{2 n+1}(x)\left((x+2) u_{2 n+2}(x)\right. \\
& \left.-u_{2 n+1}(x)\right)+(x+2) u_{2 n+2}^{2}(x)-1 \stackrel{b y(b)}{=}(x+2) u_{2 n+2}(x) u_{2 n+3}(x) \\
& -\left(u_{2 n+1}^{2}(x)+(x+2) u_{2 n+2}^{2}(x)-1\right)+u_{2 n+1}^{2}(x)+(x+2) u_{2 n+2}^{2}(x)-1 \\
& =(x+2) u_{2 n+2}(x) u_{2 n+3}(x)
\end{aligned}
$$

hence $(a)$ is true for $n+1$.

$$
\begin{aligned}
& u_{2 n+3}^{2}(x)+(x+2) u_{2 n+4}^{2}(x)-1=u_{2 n+3}^{2}(x)+(x+2) u_{2 n+4}(x)\left(u_{2 n+3}(x)\right. \\
&\left.-u_{2 n+2}(x)\right)-1=u_{2 n+3}^{2}(x)+(x+2) u_{2 n+4}(x) u_{2 n+3}(x) \\
&-(x+2) u_{2 n+4}(x) u_{2 n+2}(x)-1 \\
&=u_{2 n+3}^{2}(x)+(x+2) u_{2 n+4}(x) u_{2 n+3}(x) \\
&-(x+2)\left(u_{2 n+3}(x)-u_{2 n+2}(x)\right) u_{2 n+2}(x)-1 \\
&=u_{2 n+3}^{2}(x)+(x+2) u_{2 n+2}^{2}(x)-1+(x+2) u_{2 n+4}(x) u_{2 n+3}(x) \\
&-(x+2) u_{2 n+3}(x) u_{2 n+2}(x) \\
& \quad+(x+2) u_{2 n+4}(x) u_{2 n+3}(x)-(x+2) u_{2 n+3}(x) u_{2 n+2}(x) \\
&=(x+2) u_{2 n+4}(x) u_{2 n+3}(x)
\end{aligned}
$$

so we obtain (b) for $n+1$.

Now we pass to the lemma expressing polynomial $w_{n}$ by $u_{n}$.
Lemma 3. For every $n \geq 1$
( $\alpha$ )

$$
\begin{aligned}
w_{2 n+1}(x) & =(2-x) u_{2 n+1}^{2}(x), \\
w_{2 n}(x) & =\left(x^{2}-4\right) u_{2 n}^{2}(x) .
\end{aligned}
$$

Proof. For $n=2$ it is obvious. Assume that lemma is true for $n$. We prove lemma for $n+1$. Using Lemma 1 and Lemma 2 we have

$$
\begin{aligned}
w_{2 n+2}(x) & \stackrel{L 1}{=}-x w_{2 n+1}(x)-w_{2 n}(x)+2 x-4=-x(2-x) u_{2 n+1}^{2}(x) \\
& -\left(x^{2}-4\right) u_{2 n}^{2}(x)+2 x-4 \\
& \stackrel{L 2 a}{=}\left(x^{2}-2 x\right) u_{2 n+1}^{2}(x)-\left(x^{2}-4\right) u_{2 n}^{2}(x)+2 x-4 \\
& +(2 x-4)\left(u_{2 n+1}^{2}(x)-(x+2) u_{2 n}(x) u_{2 n+1}(x)-1+u_{2 n}^{2}(x)(x+2)\right) \\
& =\left(x^{2}-4\right) u_{2 n+1}^{2}(x)+\left(x^{2}-4\right) u_{2 n}^{2}(x)-2\left(x^{2}-4\right) u_{2 n}(x) u_{2 n+1}(x) \\
& =\left(x^{2}-4\right)\left(u_{2 n+1}^{2}(x) u_{2 n}^{2}(x)-2 u_{2 n}(x) u_{2 n+1}(x)\right) \\
& =\left(x^{2}-4\right)\left(u_{2 n+1}(x)-u_{2 n}(x)\right)^{2}=\left(x^{2}-4\right) u_{2 n+2}^{2}(x)
\end{aligned}
$$

so we obtain $(\beta)$ for $n+1$.
By Lemma 1 and 2 and $(\beta)$ for $n+1$ we have

$$
\begin{aligned}
(2-x) u_{2 n+3}^{2}(x) & =(2-x)\left((x+2) u_{2 n+2}(x)-u_{2 n+1}(x)\right)^{2} \\
& \stackrel{L 2 b}{=}(2-x)\left((x+2) u_{2 n+2}(x)-u_{2 n+1}(x)\right)^{2} \\
& +(2 x-4)\left((x+2) u_{2 n+2}^{2}(x)+u_{2 n+1}^{2}(x)\right. \\
& \left.-1-(x+2) u_{2 n+2}(x) u_{2 n+1}(x)\right)=
\end{aligned}
$$

$$
\begin{aligned}
& =(x-2)\left(-(x+2)^{2} u_{2 n+2}^{2}(x)\right. \\
& +2(x+2) u_{2 n+1}(x) u_{2 n+2}(x)-u_{2 n+1}^{2}(x) \\
& +2(x+2) u_{2 n+2}^{2}(x)+2 u_{2 n+1}^{2}(x)-2 \\
& -2(x+2) u_{2 n+2}(x) u_{2 n+1}(x) \\
& =(x-2)\left(u_{2 n+2}^{2}(x)\left(-x^{2}-2 x\right)+u_{2 n+1}^{2}-2\right) \\
& =-x\left(x^{2}-4\right) u_{2 n+2}^{2}(x)-(2-x) u_{2 n+1}^{2}(x)-2 x+4 \\
& \stackrel{(\beta)}{=}-x w_{2 n+2}(x)-w_{2 n+1}(x)-2 x+4 \stackrel{L 1}{=} w_{2 n+3}(x)
\end{aligned}
$$

hence $(\alpha)$ is true for $n+1$.

Lemma 4. Let $n \in N$ and $0 \leq j, k \leq\left[\frac{n}{2}\right]$. Then

$$
x_{n, j} \cdot x_{n, k}=x_{n,|k-j|}+x_{n, g_{n}(k+j)} .
$$

Proof. Consider the following cases:

1. $n$ is odd and $j+k \leq\left[\frac{n}{2}\right]$. Then

$$
\begin{aligned}
& x_{n, j} \cdot x_{n, k}=2 \cos \left(\frac{2 j \pi}{n}\right) 2 \cos \left(\frac{2 k \pi}{n}\right) \\
& =2\left(\cos \left(\frac{2(j-k) \pi}{n}\right)+\cos \left(\frac{2(j+k) \pi}{n}\right)\right) \\
& =x_{n,|k-j|}+x_{n, g_{n}(k+j)} .
\end{aligned}
$$

2. $n$ is odd and $j+k>\left[\frac{n}{2}\right]$. Then $g_{n}(j+k)=n-(j+k)$ and

$$
\begin{aligned}
& x_{n, j} \cdot x_{n, k}=2 \cos \left(\frac{2 j \pi}{n}\right) 2 \cos \left(\frac{2 k \pi}{n}\right) \\
& =2\left(\cos \left(\frac{2(j-k) \pi}{n}\right)+\cos \left(\frac{2(j+k) \pi}{n}\right)\right) \\
& =2\left(\cos \left(\frac{2(j-k) \pi}{n}\right)+\cos \left(2 \pi-\frac{2(j+k) \pi}{n}\right)\right) \\
& =2 \cos \left(\frac{2(j-k) \pi}{n}\right)+\cos \left(\frac{2(n-(j+k)) \pi}{n}\right)=x_{n,|k-j|}+x_{n, g_{n}(k+j)}
\end{aligned}
$$

3. $n$ is even and $j+k \leq\left[\frac{n}{2}\right]$. Then

$$
\begin{aligned}
& x_{n, j} \cdot x_{n, k}=(-1)^{j} 2 \cos \left(\frac{j \pi}{n}\right)(-1)^{k} 2 \cos \left(\frac{k \pi}{n}\right) \\
& =(-1)^{j+k} 2\left(\cos \left(\frac{(j-k) \pi}{n}\right)+\cos \left(\frac{(j+k) \pi}{n}\right)=x_{n,|k-j|}+x_{n, g_{n}(j+k)} .\right.
\end{aligned}
$$

4. $n$ is even and $j+k>\left[\frac{n}{2}\right]$. Then

$$
\begin{aligned}
& x_{n, j} \cdot x_{n, k}=(-1)^{j} 2 \cos \left(\frac{j \pi}{n}\right)(-1)^{k} 2 \cos \left(\frac{k \pi}{n}\right) \\
& =(-1)^{j+k} 2\left(\cos \left(\frac{(j-k) \pi}{n}\right)+\cos \left(\frac{(j+k) \pi}{n}\right)\right) \\
& =(-1)^{k-j} 2 \cos \left(\frac{(j-k) \pi}{n}\right)+(-1)^{j+k} 2(-1) \cos \left(\pi-\frac{(j+k) \pi}{n}\right) \\
& =(-1)^{k-j} 2 \cos \left(\frac{(j-k) \pi}{n}\right)+(-1)^{n-(j+k)} 2 \cos \left(\pi-\frac{(j+k) \pi}{n}\right) \\
& =x_{n,|k-j|}+x_{n, g_{n}(j+k) .}
\end{aligned}
$$

Lemma 5. Let $n \in \mathbb{N}, y \in \mathbb{Z}$ and $j \in\left\{0,1, \ldots,\left[\frac{n}{2}\right]\right\}$. Then

$$
\left\{g_{n}\left(j+g_{n}(y)\right),\left|g_{n}(y)-j\right|\right\}=\left\{g_{n}(y-j), g_{n}(y+j)\right\}
$$

Proof. There exists $k \in \mathbb{Z}$ such that $k n \leq y \leq k n+n$. Let us consider the following cases:

1. If $y-k n \leq\left[\frac{n}{2}\right]$ then $g_{n}(y)=y-k n$ and

$$
\begin{aligned}
& g_{n}(y+j)=\operatorname{dist}(y+j, n \mathbb{Z})=\operatorname{dist}(y-k n+j, n \mathbb{Z}) \\
& =\operatorname{dist}\left(g_{n}(y)+j, n \mathbb{Z}\right)=g_{n}\left(g_{n}(y)+j\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& g_{n}(y-j)=\operatorname{dist}(y-j, n \mathbb{Z})=\operatorname{dist}(y-k n-j, n \mathbb{Z}) \\
& =\operatorname{dist}\left(g_{n}(y)-j, n \mathbb{Z}\right)=\left|g_{n}(y)-j\right|
\end{aligned}
$$

2. If $k n+n-y \leq\left[\frac{n}{2}\right]$ then $g_{n}(y)=k n+n-x$ and

$$
\begin{aligned}
& g_{n}(y-j)=\operatorname{dist}(y-j, n \mathbb{Z})=\operatorname{dist}(j-y, n \mathbb{Z}) \\
& =\operatorname{dist}(k n+n-y+j, n \mathbb{Z})=\operatorname{dist}\left(g_{n}(y)+j, n \mathbb{Z}\right)=g_{n}\left(g_{n}(y)+j\right)
\end{aligned}
$$

and

$$
\begin{aligned}
& g_{n}(y+j)=\operatorname{dist}(y+j, n \mathbb{Z})=\operatorname{dist}(-y-j, n \mathbb{Z})= \\
& \operatorname{dist}(k n+n-y-j, n \mathbb{Z})=\operatorname{dist}\left(g_{n}(y)-j, n \mathbb{Z}\right)=\left|g_{n}(y)-j\right|
\end{aligned}
$$

Now we find eigenvectors for the matrix $a_{2}$.
Let $n \in \mathbb{N}$ and $0 \leq j \leq\left[\frac{n}{2}\right]$. Let

$$
v_{n, j}=\left[x_{n, g_{n}(0)}, x_{n, g_{n}(j)}, x_{n, g_{n}(2 j)}, \ldots, x_{n, g_{n}(k j)}, \ldots, x_{\left.n, g_{n}((n-1) j)\right)}\right] \in \mathbb{C}^{n}
$$

Lemma 6. Let $0 \leq j \leq\left[\frac{n}{2}\right]$. Then vector $v_{n, j}$ is an eigenvector of the matrix $a_{2}$ corresponding to an eigenvalue $x_{n, j}$.

Proof. We must show that

$$
\begin{equation*}
x_{n, j} \cdot x_{n, g_{n}(k j)}=x_{n, g_{n}((k-1) j)}+x_{n, g_{n}((k+1) j)} \tag{*}
\end{equation*}
$$

for $k=1,2, \ldots, n-1$ and
(**)

$$
x_{n, j} \cdot x_{n, g_{n}(0)}=x_{n, g_{n}(j)}+x_{n, g_{n}((n-1) j)}
$$

and
$(* * *) \quad x_{n, j} \cdot x_{n, g_{n}((n-1) j)}=x_{n, g_{n}(0)}+x_{n, g_{n}((n-2) j)}$.
By Lemma 4 we have

$$
x_{n, j} \cdot x_{n, g_{n}(k j)}=x_{n,\left|j-g_{n}(k j)\right|}+x_{n, g_{n}\left(j+g_{n}(k j)\right) .}
$$

Hence

$$
x_{n, j} \cdot x_{n, g_{n}(k j)}=x_{n, g_{n}((k-1) j)}+x_{n, g_{n}((k+1) j)},
$$

by Lemma 5 for $y=k j$ and this ends the proof of $(*)$.
Obviously $g_{n}(0)=0$ and $g_{n}(j)=j$. Moreover

$$
g_{n}((n-1) j)=\operatorname{dist}(n j-j, n \mathbb{Z})=\operatorname{dist}(-j, n \mathbb{Z})=\operatorname{dist}(j, n \mathbb{Z})=g_{n}(j) .
$$

Therefore

$$
x_{n, j} \cdot x_{n, g_{n}(0)}=x_{n, j} \cdot x_{n, 0}=x_{n, j}+x_{n, g_{n}(j)}=x_{n, g_{n}(j)}+x_{n, g_{n}((n-1) j)}
$$

and ( $* *$ ) was proved.
We have

$$
\begin{aligned}
& x_{n, j} \cdot x_{n, g_{n}((n-1) j)}=x_{n, j} \cdot x_{n, g_{n}(j)}=x_{n, j} \cdot x_{n, j}=x_{n, 0}+x_{n, g_{n}(2 j)} \\
& =x_{n, g_{n}(0)}+x_{n, g(-2 j)}=x_{n, g_{n}(0)}+x_{n, g_{n}((n-2) j)}
\end{aligned}
$$

and $(* * *)$ was shown.

Notice that if the vector $\left[y_{1}, y_{2}, \ldots, y_{n}\right]$ is an eigenvector for the matrix $a_{2}$ then the vector $\left[y_{n}, y_{1}, y_{2}, \ldots, y_{n-1}\right]$ is also an eigenvector for the matrix $a_{2}$.

Let $n \in \mathbb{N}$ and $0 \leq j \leq\left[\frac{n}{2}\right]$. Let
$u_{n, j}=$
$\left[x_{\left.n, g_{n}((n-1) j)\right)}, x_{n, g_{n}(0)}, x_{n, g_{n}(j)}, x_{n, g_{n}(2 j)}, \ldots, x_{n, g_{n}(k j)}, \ldots, x_{\left.n, g_{n}((n-2) j)\right)}\right] \in \mathbb{C}^{n}$.
Let $E_{n, j+1}=\operatorname{lin}\left(v_{n, j}, u_{n, j}\right)$ and $e_{n, j+1}$ be a matrix of the projection $\mathbb{C}^{n}$ onto $E_{n, j+1}$.

## Lemma 7.

$$
\operatorname{dim} E_{n, j}= \begin{cases}1 & \text { for } j=1 \text { or }\left(j=\frac{n}{2}+1 \text { and } 2 \mid n\right) \\ 2 & \text { otherwise } .\end{cases}
$$

Proof. If $j=1$ then $E_{n, 1}=\operatorname{lin}\left(v_{n, 0}, u_{n, 0}\right)=\operatorname{lin}\left(\left[x_{n, 0}, \ldots, x_{n, 0}\right],\left[x_{n, 0}\right.\right.$, $\left.\ldots, x_{n, 0}\right]$ ), so $\operatorname{dim} E_{n, 1}=1$.

If $2 \mid n$ and $j=\frac{n}{2}+1$ then $v_{n, j-1}=\left[2,-2,2, \ldots,(-1)^{n+1} 2\right]$ (since $x_{n, \frac{n}{2}}=-2, x_{n, 0}=2$ and $g_{n}\left(\frac{n k}{2}\right)=0$ for $k$ odd and $g_{n}\left(\frac{n k}{2}\right)=\frac{n}{2}$ for $k$ even) and $u_{n, j-1}=(-1)^{n+1} v_{n, j-1}$ hence $\operatorname{dim} E_{n, j}=1$.

Otherwise

$$
\operatorname{det}\left[\begin{array}{cc}
x_{n, g_{n}(0)} & x_{n, g_{n}(j-1)} \\
x_{n, g_{n}((n-1)(j-1))} & x_{n, g_{n}(0)}
\end{array}\right]=x_{n, 0}^{2}-x_{n, j-1}^{2}=4-x_{n, j-1}^{2} \neq 0
$$

hence $v_{n, j-1}$ and $u_{n, j-1}$ are linear independent vectors.
Observe that $\operatorname{dim} E_{n, 1}+\ldots+\operatorname{dim} E_{n,\left[\frac{n}{2}\right]+1}=n$ and $\mathbb{C}^{n}=E_{n, 1} \oplus \ldots \oplus E_{n,\left[\frac{n}{2}\right]+1}$.
Lemma 8. If $n=2 r+1$ and $r>3$ then

$$
u_{n}(x)=x^{r}+x^{r-1}+(1-r) x^{r-2}+\ldots
$$

If $n=2 r$ and $r>2$ then

$$
u_{n}(x)=x^{r-1}+0 \cdot x^{r-2}+(2-r) x^{r-3}+\ldots
$$

Proof. $u_{5}(x)=x^{2}+x-1$ and $u_{6}(x)=x^{2}-1$. Therefore lemma is true for $n=5$ and $n=6$.

If lemma is true for $n=2 r$ and $n=2 r-1$ then

$$
\begin{aligned}
& u_{2 r+1}(x)=(x+2) u_{2 r}-u_{2 r-1}(x) \\
& =(x+2)\left(x^{r-1}+(2-r) x^{r-3}+\ldots\right)-\left(x^{r-1}+x^{r-2}+(1-(r-1)) x^{r-3}+\ldots\right) \\
& =x^{r}+(2-1) x^{r-1}+((2-r)-1) x^{r-2}+\ldots
\end{aligned}
$$

and

$$
\begin{aligned}
& u_{2 r+2}(x)=u_{2 r+1}(x)-u_{2 r}(x) \\
& =x^{r}+x^{r-1}+(1-r) x^{r-2}+\ldots-\left(x^{r-1}+(2-r) x^{r-3}+\ldots\right) \\
& =x^{r}+(1-1) x^{r-1}+(1-r-0) x^{r-2}+\ldots=x^{r}+0 \cdot x^{r-1}+(1-r) x^{r-2}+\ldots
\end{aligned}
$$

Hence lemma is true for $n=2 r+1$ and $n=2 r+2$.

## Lemma 9.

$$
x_{n, 0}^{2}+\ldots+x_{n,\left[\frac{n}{2}\right]}^{2}=\left\{\begin{array}{l}
n+2 \text { for } n \text { even } \\
n+4 \text { for } n \text { odd }
\end{array}\right.
$$

Proof. Consider the following cases:

1. If $n$ is even and $n=2 k+1$. By Lemma 6 we know that $x_{n, 1}, \ldots, x_{n, k}$ are eigenvalues of the matrix $a_{2}$. Hence they are roots of $w_{n}$. Obviously $x_{n_{i}} \neq 2$ for $i=1, \ldots, k$, so by Lemma 3 they are roots of $u_{n}$. Therefore we have
(*)

$$
u_{n}(x)=\left(x-x_{n, 1}\right)\left(x-x_{n, 2}\right) \ldots\left(x-x_{n, k}\right)
$$

Using Lemma 8 we obtain $x_{n, 1}+\ldots+x_{n, k}=-1$ and $\sum_{1 \leq i<j \leq k} x_{n, i} x_{n, j}$ $=1-k$.

Hence

$$
\begin{aligned}
& x_{n, 1}^{2}+\ldots+x_{n, k}^{2}=\left(x_{n, 1}+\ldots+x_{n, k}\right)^{2}-2 \sum_{1 \leq i<j \leq k} x_{n, i} x_{n, j} \\
& =1-2(1-k)=2 k-1=n-2
\end{aligned}
$$

and $x_{n, 0}^{2}+x_{n, 1}^{2}+\ldots+x_{n, k}^{2}=4+n-2=n+2$.
2. Assume that $n$ is odd and $n=2 k$. Then

$$
\begin{equation*}
u_{n}(x)=\left(x-x_{n, 1}\right)\left(x-x_{n, 2}\right) \ldots\left(x-x_{n, k-1}\right) \tag{**}
\end{equation*}
$$

because $x_{n, 1}, \ldots, x_{n, k-1}$ are eigenvalues of the matrix $a_{2}$ by Lemma 6 , hence they are roots of $w_{n}$ and by Lemma 3 they are also roots of $u_{n}$. So by Lemma 8 we have ( $* *$ ).

By Lemma 8 it turns out that $x_{n, 1}+\ldots+x_{n, k-1}=0$ and $\sum_{1 \leq i<j \leq k-1}$ $x_{n, i} x_{n, j}=2-k$.

Hence

$$
\begin{aligned}
& x_{n, 1}^{2}+\ldots+x_{n, k-1}^{2}=\left(x_{n, 1}+\ldots+x_{n, k-1}\right)^{2}-2 \sum_{1 \leq i<j \leq k-1} x_{n, i} x_{n, j} \\
& =0-2(2-k)=2 k-4=n-4
\end{aligned}
$$

and $x_{n, 0}^{2}+x_{n, 1}^{2}+\ldots+x_{n, k-1}^{2}+x_{n, k}=4+(n-4)+4=n+4$.

Lemma 10. Let $n, k \in \mathbb{N}$ and $\operatorname{gcd}(n, k)=1$. Let $A=\left\{0,1, \ldots,\left[\frac{n}{2}\right]\right\}$ and $f: A \rightarrow A$ be a function such that $f(x)=g_{n}(k x)$. Then $f$ is a bijection.

Proof. It is sufficient to show that $f$ is $1-1$. Suppose $i, j \in A, i<j$ and $f(i)=f(j)$. Let $x=\operatorname{dist}(i k, n \mathbb{Z})=\operatorname{dist}(j k, n \mathbb{Z})$. There exist $p, q \in \mathbb{Z}$ such that $|i k-p n|=|j k-q n|$.

If $i k-p n=j k-q n$ then $(i-j) k=(p-q) n$ hence $n \mid j-i$ (since $\operatorname{gcd}(n, k)=1)$ but $j-i \in A$ and we have a contradiction.

If $i k-p n=-j k+q n$ then $(i+j) k=(p+q) n$ hence $n \mid i+j$ but $i, j \in A$ so $0<i+j \leq\left[\frac{n}{2}\right]+\left[\frac{n}{2}\right]-1<n$ and we obtain a contradiction.

Lemma 11. Let $n, k, p \in \mathbb{N}$ and $0 \leq k \leq\left[\frac{n}{2}\right]$. Then $\left|v_{p n, p k}\right|^{2}=p\left|v_{n . k}\right|^{2}$.
$\operatorname{Proof}$. Let us note that $g_{p n}(p x)=\operatorname{dist}(p x, p n \mathbb{Z})=p \cdot \operatorname{dist}(x, n \mathbb{Z})=p g_{n}(x)$ for any $x \in \mathbb{Z}, v_{n p, k p}=\left[\left(x_{\left.p n, g_{p n}((i-1) p k)\right)}\right)_{i=1, \ldots, p n}\right]=\left[\left(x_{p n, p g_{n}((i-1) k)}\right)_{i=1, \ldots, p n}\right]$ and $g_{n}((n+i-1) k)=g_{n}((i-1) k)$.

Consider the following cases:

1. If $2 \mid n$ then $x_{p n, p j}=2 \cos \left(\frac{2 p j \pi}{p n}\right)=2 \cos \left(\frac{2 j \pi}{n}\right)=x_{n, j}$. Hence $v_{n p, n k}=$ $\left[\left(x_{\left.n, g_{n}((i-1) k)\right)}\right)_{i=1, \ldots, p n}\right]$ and $v_{p n, p k}=[\underbrace{v_{n, k}, v_{n, k}, \ldots, v_{n, k}}_{p \text {-times }}]$ and $\left|v_{n, k}\right|^{2}=$ $p\left|v_{n, k}\right|^{2}$.
2. If $2 \nmid n$ and $2 \nmid p$ then $x_{p n, p j}=(-1)^{p j} 2 \cos \left(\frac{p j \pi}{p n}\right)=(-1)^{j} 2 \cos \left(\frac{j \pi}{n}\right)=x_{n, j}$, $v_{p n, p k}=[\underbrace{v_{n, k}, v_{n, k}, \ldots, v_{n, k}}_{p-\text { times }}]$ and $\left|v_{n, k}\right|^{2}=p\left|v_{n, k}\right|^{2}$.
3. If $2 \not \backslash n$ and $2 \mid p$ then $x_{p n, p j}=2 \cos \left(\frac{2 p j \pi}{p n}\right)=2 \cos \left(\frac{2 j \pi}{n}\right)=2\left(2 \cos ^{2}\left(\frac{j \pi}{n}\right)-\right.$ 1) $=4 \cos ^{2}\left(\frac{j \pi}{n}\right)-2=x_{n, j}^{2}-2$ and by Lemma 4 we have $x_{p n, p j}=$ $x_{n, 0}+x_{n, g_{n}(2 j)}-2=x_{n, g_{n}(2 j)}$. By Lemma $10 v_{p n, p k}=[\underbrace{\left.\widetilde{v_{n, k}}, \widetilde{v_{n, k}}, \ldots, \widetilde{v_{n, k}}\right]}_{p-\text { times }}$ (since $\operatorname{gcd}(2, n)=1$ ), where coordinates of $\widetilde{v_{n, k}}$ arise as a result of the permutation of coordinates of $v_{n, k}$. Hence $\left|v_{p n, p k}\right|^{2}=p\left|v_{n . k}\right|^{2}$.

Theorem 1. Let $n \in \mathbb{N}$ and $0 \leq j \leq\left[\frac{n}{2}\right]$. Then

$$
\left|v_{n, j}\right|^{2}= \begin{cases}4 n & \text { for } j=0 \text { or }\left(j=\frac{n}{2} \text { and } 2 \mid n\right) \\ 2 n & \text { otherwise. }\end{cases}
$$

Proof. Assume that $\operatorname{gcd}(n, j)=1$.
Let $n=2 r+1$. According to the fact that $g_{n}((i-1) k)=g_{n}((n-i+1) k)$ and by Lemma 10 we have

$$
\begin{aligned}
& \left|v_{n, j}\right|^{2}=\left|\left[x_{n, 0}, x_{n, 1}, \ldots, x_{n, r}, x_{n, r}, \ldots, x_{n, 1}\right]\right|^{2}=2\left(x_{n, 0}^{2}+\ldots+x_{n, r}^{2}\right)-x_{n, 0}^{2} \\
& =2(n+2)-4=2 n
\end{aligned}
$$

using Lemma 9.
Let $n=2 r$. Then

$$
\left|v_{n, j}\right|^{2}=\left|\left[x_{n, 0}, x_{n, 1}, \ldots, x_{n, r-1}, x_{n, r}, x_{n, r-1}, \ldots, x_{n, 1}\right]\right|^{2}
$$

by Lemma 10. Hence

$$
\left|v_{n, j}\right|^{2}=2\left(x_{n, 0}^{2}+\ldots+x_{n, r}^{2}\right)-x_{n, 0}^{2}-x_{n, r}^{2}=2(n+4)-4-4=2 n,
$$

by Lemma 9 .

Assume that $\operatorname{gcd}(n, j) \neq 1$. Let $p=\operatorname{gcd}(n, j), n=p n^{\prime}, j=p j^{\prime}$, where $\operatorname{gcd}\left(n^{\prime}, j^{\prime}\right)=1$. By Lemma 11 we have $\left|v_{n, j}\right|^{2}=p\left|v_{n^{\prime}, j^{\prime}}\right|^{2}$.

One needs to consider the following cases:

1. If $j=0$ then $v_{n, j}=[\underbrace{2,2, \ldots 2}_{n \text {-times }}]$ and $\left|v_{n, j}\right|^{2}=4 n$.
2. If $2 \nmid n$ and $j \neq 0$ then $2 \nmid n^{\prime}$ and $\left|v_{n, j}\right|^{2}=p\left|v_{n^{\prime}, j^{\prime}}\right|^{2}=p 2 n^{\prime}=2 n$.
3. If $2 \mid n, 2 \nmid n^{\prime}$ and $j \neq 0$ then $2 \mid p$ and $j \neq \frac{n}{2}$ (because if $j=\frac{n}{2}$ then $\frac{p}{2} n^{\prime}=j=p j^{\prime}=\frac{p}{2} 2 j^{\prime}$ and $n^{\prime}=2 j^{\prime}$ but $\left.2 \nmid n^{\prime}\right)$. Hence $\left|v_{n, j}\right|^{2}=p\left|v_{n^{\prime}, j^{\prime}}\right|^{2}=$ $p 2 n^{\prime}=2 n$.
4. If $2|n, 2| n^{\prime}$ and $j^{\prime}=\frac{n^{\prime}}{2}$ then $j=p j^{\prime}=p \frac{n^{\prime}}{2}=\frac{n}{2}$ and $\left|v_{n, j}\right|^{2}=p\left|v_{n^{\prime}, j^{\prime}}\right|^{2}=$ $p 4 n^{\prime}=4 n$.
5. If $2|n, 2| n^{\prime}, j \neq 0$ and $j^{\prime} \neq \frac{n^{\prime}}{2}$ then $j^{\prime} \neq 0, j \neq \frac{n}{2}$ and $\left|v_{n, j}\right|^{2}=p\left|v_{n^{\prime}, j^{\prime}}\right|^{2}=$ $p 2 n^{\prime}=2 n$.

Let $b=\left(b_{i j}\right)_{1 \leq i, j \leq n} \in M_{n}(\mathbb{C})$ be a matrix. Then let $\bar{b}=\left[b_{11}, \ldots, b_{1 n}\right]$. Obviously ${ }^{-}$is a linear operation.

For $1 \leq i \leq\left[\frac{n}{2}\right]$ let $e_{i}$ be a matrix of the projection of $\mathbb{C}^{n}$ onto $E_{n, i}$. We know (see [3]) that $\operatorname{lin}\left(a_{1}, \ldots, a_{\left[\frac{n}{2}\right]+1}\right)=\operatorname{lin}\left(e_{1}, \ldots, e_{\left[\frac{n}{2}\right]+1}\right)$.

Let $n \in \mathbb{N}, 1 \leq i \leq\left[\frac{n}{2}\right]$ and $a_{i}=\sum_{j=1}^{\left[\frac{n}{2}\right]+1} \xi_{i j} e_{j}$.
Lemma 12. Let $n \in \mathbb{N}$ and $1 \leq i, j \leq\left[\frac{n}{2}\right]+1$. Then

$$
\xi_{i, j}=\left\{\begin{array}{l}
1 \text { for } i=1 \text { or }\left(i=\frac{n}{2}+1,(2 \mid n) \text { and } j=1\right) \\
2 \text { for } j=1 \text { and } i \neq 1 \text { and }\left(\text { if } 2 \mid n \text { then } i \neq \frac{n}{2}+1\right) \\
\frac{1}{2} x_{n, g_{n}((i-1)(j-1))} \text { for } 2 \mid n \text { and } i=\frac{n}{2}+1 \text { and } j \neq 1 \\
x_{n, g_{n}((i-1)(j-1))} \text { otherwise. }
\end{array}\right.
$$

Proof. It is obvious that

$$
\bar{a}_{i}=\sum_{j=1}^{\left[\frac{n}{2}\right]+1} \xi_{i j} \bar{e}_{j} \quad \text { and } \quad \bar{e}_{j}=\frac{[1,0, \ldots, 0] \circ v_{n, j-1}}{\left|v_{n, j-1}\right|^{2}} v_{n, j-1}=\frac{2 v_{n, j-1}}{\left|v_{n, j-1}\right|^{2}}
$$

where o means the scalar product of vectors. Using Theorem 1 we have

$$
\bar{e}_{j}= \begin{cases}\frac{1}{2 n} v_{n, j-1} & \text { for } j=1 \text { or }\left(j=\frac{n}{2}+1 \text { and } 2 \mid n\right) \\ \frac{1}{n} v_{n, j-1} & \text { otherwise }\end{cases}
$$

Hence $\bar{e}_{1}, \ldots, \bar{e}_{\left[\frac{n}{2}\right]+1}$ are pairwise orthogonal. Therefore $\xi_{i, j}=\frac{\bar{a}_{i} \circ \bar{e}_{j}}{\left|\bar{e}_{j}\right|^{2}}$.
Consider the following cases:

1. If $i=1$ and $j=1$ or $\left(j=\frac{n}{2}+1\right.$ and $\left.2 \mid n\right)$ then

$$
\xi_{1, j}=\frac{\bar{a}_{1} \circ \bar{e}_{j}}{\left|\bar{e}_{j}\right|^{2}}=\frac{\frac{1}{2 n} 2}{\left.\frac{1}{4 n^{2}} \right\rvert\, v_{n, j-1 \mid}}=\frac{\frac{1}{n}}{\frac{1}{4 n^{2}} 4 n}=1
$$

2. If $i=1$ and $j \neq 1$ and $\left(j \neq \frac{n}{2}+1\right.$ if $\left.2 \mid n\right)$ then

$$
\xi_{1, j}=\frac{\bar{a}_{1} \circ \bar{e}_{j}}{\left|\bar{e}_{j}\right|^{2}}=\frac{\frac{1}{n} 2}{\frac{1}{n^{2}}\left|v_{n, j-1 \mid}\right|}=\frac{\frac{2}{n}}{\frac{1}{n^{2}} 2 n}=1 .
$$

3. If $i=\frac{n}{2}+1,2 \mid n$ and $j=1$ then

$$
\xi_{i, 1}=\frac{\bar{a}_{i} \circ \bar{e}_{1}}{\left|\bar{e}_{1}\right|^{2}}=\frac{\frac{1}{n}}{\frac{1}{4 n^{2}} 4 n}=1
$$

4. If $j=1$ and $i \neq 1$ and $\left(i \neq \frac{n}{2}+1\right.$ if $\left.2 \mid n\right)$ then

$$
\xi_{i, 1}=\frac{\bar{a}_{i} \circ \bar{e}_{1}}{\left|\bar{e}_{1}\right|^{2}}=\frac{\frac{2}{n}}{\frac{1}{4 n^{2}} 4 n}=2
$$

5. If $2 \mid n$ and $i=\frac{n}{2}+1, j \neq 1$ and $j \neq \frac{n}{2}+1$ then

$$
\xi_{i, j}=\frac{\bar{a}_{i} \circ \bar{e}_{j}}{\left|\bar{e}_{j}\right|^{2}}=\frac{\frac{1}{n} x_{n, g_{n}\left(\frac{n}{2}(j-1)\right)}}{\frac{1}{n^{2}}\left|v_{n, j-1}\right|^{2}}=\frac{1}{2} x_{n, g_{n}\left(\frac{n}{2}(j-1)\right)} .
$$

6. If $2 \mid n$ and $i=\frac{n}{2}+1$ and $j=\frac{n}{2}+1$ then

$$
\xi_{i, j}=\frac{\bar{a}_{i} \circ \bar{e}_{j}}{\left|\bar{e}_{j}\right|^{2}}=\frac{\frac{1}{2 n} x_{n, g_{n}\left(\frac{n}{2} \frac{n}{2}\right)}^{\frac{1}{4 n^{2}}\left|v_{n, j-1}\right|^{2}}=\frac{1}{2} x_{n, g_{n}\left(\frac{n}{2} \frac{n}{2}\right)} . . . . . . . .}{} .
$$

7. If $2 \mid n$ and $j=\frac{n}{2}+1, i \neq 1$ and $i \neq \frac{n}{2}+1$ then $\bar{a}_{i}=\left[b_{1}, \ldots, b_{n}\right]$, where

$$
b_{j}= \begin{cases}1 & \text { for } j=i \text { or } j=n-i+2 \\ 0 & \text { for } j \neq i \text { and } j \neq n-i+2 .\end{cases}
$$

Moreover $v_{n, \frac{n}{2}}=\left[2,-2, \ldots 2(-1)^{n+1}\right]$. Hence

$$
\xi_{i, j}=\frac{\frac{1}{2 n}\left(2(-1)^{i+1}+2(-1)^{n-i+1}\right)}{\frac{1}{4 n^{2}} 4 n}=2(-1)^{i+1}=x_{n, g_{n}\left((i-1) \frac{n}{2}\right)} .
$$

8. If $i \neq 1, j \neq 1,\left(i \neq \frac{n}{2}+1\right.$ and $j \neq \frac{n}{2}+1$ if $\left.2 \mid n\right)$ then

$$
\begin{aligned}
\xi_{i, j} & =\frac{\frac{1}{n}\left(x_{n, g_{n}((i-1)(j-1))}+x_{n, g_{n}((n-i+1)(j-1))}\right)}{\frac{1}{n^{2}} 2 n} \\
& =\frac{\frac{2}{n} x_{n, g_{n}((i-1)(j-1))}^{\frac{1}{n^{2}}} 2 n}{}=x_{n, g_{n}((i-1)(j-1))} .
\end{aligned}
$$

Let $f_{i}=\operatorname{dim}_{\mathbb{C}} E_{n, i}, n_{j}=\frac{\left|C_{j}\right|}{n}$ and $\varphi_{i, j}=\sqrt{f_{i}} \xi_{j, i} n_{j}^{-1}$ for $i, j \in\left\{1, \ldots,\left[\frac{n}{2}\right]\right\}$. Then $\left(\varphi_{i, j}\right)_{1 \leq i, j \leq\left[\frac{n}{2}\right]}$ is the character table of the quasigroup $\left(\mathbb{Z}_{n},-_{n}\right)$.

The next Theorem gives the description of the character table of the quasigroup $\left(\mathbb{Z}_{n},-{ }_{n}\right)$.

Theorem 2. Let $n \in \mathbb{N}$ and $1 \leq i, j \leq\left[\frac{n}{2}\right]+1$. Then

$$
\varphi_{i, j}=\left\{\begin{array}{l}
1 \text { for } i=1 \text { or }\left(i=\frac{n}{2}+1,(2 \mid n) \text { and } j=1\right) \\
\sqrt{2} \text { for } j=1 \text { and } i \neq 1 \text { and }\left(\text { if } 2 \mid n \text { then } i \neq \frac{n}{2}+1\right) \\
(-1)^{j-1} \text { for } 2 \mid n \text { and } i=\frac{n}{2}+1 \text { and } j \neq 1 \\
\frac{\sqrt{2}}{2} x_{n, g_{n}((i-1)(j-1))} \text { otherwise. }
\end{array}\right.
$$

Hence for $n$ even we obtain

|  | $j=1$ | $j \neq 1$ |
| :---: | :---: | :---: |
| $i=1$ | $\varphi_{i, j}=1$ | $\varphi_{i, j}=1$ |
| $i \neq 1$ | $\varphi_{i, j}=\sqrt{2}$ | $\varphi_{i, j}=\frac{\sqrt{2}}{2} x_{n, g_{n}((i-1)(j-1))}$ |

and for $n$ odd we have

|  | $j=1$ | $j \neq 1, j \neq \frac{n}{2}+1$ | $j=\frac{n}{2}+1$ |
| :---: | :---: | :---: | :---: |
| $i=1$ | $\varphi_{i, j}=1$ | $\varphi_{i, j}=1$ | $\varphi_{i, j}=1$ |
| $i \neq 1, i \neq \frac{n}{2}+1$ | $\varphi_{i, j}=\sqrt{2}$ | $\varphi_{i, j}=\frac{\sqrt{2}}{2} x_{n, g_{n}((i-1)(j-1))}$ | $\varphi_{i, j}=\frac{\sqrt{2}}{2} x_{n, g_{n}((i-1)(j-1))}$ |
| $i=\frac{n}{2}+1$ | $\varphi_{i, j}=1$ | $\varphi_{i, j}=(-1)^{j-1}$ | $\varphi_{i, j}=(-1)^{\frac{n}{2}}$ |

Proof. We must consider the following cases (we use Lemma 7 to calculate $f_{i}$ ):

1. If $i=1$ and $\left(j=1\right.$ or $\left(j=\frac{n}{2}+1\right.$ and $\left.\left.2 \mid n\right)\right)$ then

$$
\varphi_{i, j}=\sqrt{1} \xi_{j, i} \frac{n}{n}=1
$$

2. If $i=1, j \neq 1$ and (if $2 \mid n$ then $j \neq \frac{n}{2}+1$ ) then

$$
\varphi_{i, j}=\sqrt{1} \xi_{j, i} \frac{n}{2 n}=1 .
$$

3. If $2 \mid n, i=\frac{n}{2}+1$ and $j=1$ then

$$
\varphi_{i, j}=\sqrt{1} \xi_{j, i} \frac{n}{n}=1
$$

4. If $2 \mid n, i=\frac{n}{2}+1$ and $j=\frac{n}{2}+1$ then

$$
\varphi_{i, j}=\sqrt{1} \xi_{j, i} \frac{n}{n}=\frac{1}{2} x_{n, g_{n}\left(\frac{n}{2} \frac{n}{2}\right)}=(-1)^{\frac{n}{2}}=(-1)^{j-1}
$$

5. If $2 \mid n, i=\frac{n}{2}+1$ and $j \neq 1$ and $j \neq \frac{n}{2}+1$ then

$$
\varphi_{i, j}=\sqrt{1} \xi_{j, i} \frac{n}{2 n}=\frac{1}{2} x_{n, g_{n}\left((j-1) \frac{n}{2}\right)}=(-1)^{j-1} .
$$

6. If $i \neq 1$ and $j=1$ and (if $2 \mid n$ then $i \neq \frac{n}{2}+1$ )then

$$
\varphi_{i, j}=\sqrt{2} \xi_{j, i} \frac{n}{n}=\sqrt{2}
$$

7. If $i \neq 1$ and $i \neq \frac{n}{2}+1$ and $2 \mid n$ and $j=\frac{n}{2}+1$ then

$$
\varphi_{i, j}=\sqrt{2} \xi_{j, i} \frac{n}{n}=\sqrt{2} \frac{1}{2} x_{n, g_{n}\left(\frac{n}{2}(i-1)\right)}=\sqrt{2}(-1)^{\frac{n}{2}}=\sqrt{2} \frac{1}{2} x_{n, g_{n}((i-1)(j-1))} .
$$

8. If $i \neq 1$ and (if $2 \mid n$ then $i \neq \frac{n}{2}+1$ ) and $j \neq 1$ and (if $2 \mid n$ then $j \neq \frac{n}{2}+1$ ) then

$$
\varphi_{i, j}=\sqrt{2} \xi_{j, i} \frac{n}{2 n}=\frac{\sqrt{2}}{2} x_{n, g_{n}((i-1)(j-1))} .
$$
